

ABSTRACT

[24] The present invention is a bathing apparatus for use in a bathing vessel consisting of a flexible sheet and attachment means for attaching the flexible sheet to a surface of a bathing vessel. The flexible sheet is attached such that it is substantially in contact with the surface of the bathing vessel. In addition, connecting means are provided which removably connect the attachment means to the flexible sheet. Preferably, the flexible sheet of the bathing apparatus is made with a non-slip surface such as terry cloth or other fabric toweling type material. In addition, it is preferable that the flexible sheet be manufactured from a machine washable fabric. Typically, the flexible sheet will be rectangular in shape and the attachment means can be connected to the flexible sheet at each corner of the rectangle.
